VOL. V. SUMMER NUMBER NO. 1
JULY, 1921

HOMOPTERA OF FLORIDA

HERBERT OSBORN

The following list is an attempt to bring together all available data on the Homopteran fauna of Florida. The list published by Professor Barber⁽¹⁾ naturally forms the basis for any such effort and I have included the records there given with the authorities. I have, however, adopted the nomenclature and arrangement of Van Duzee's Catalogue in the main, as this will be for many years the most convenient means of comparison.

The numerous additions to the Barber list are largely due to active collecting by Professor C. J. Drake, whose summer captures in 1918 were turned over to me for study and a number are due to specimens submitted to me by Professor J. R. Watson of the Florida Experiment Station, while a few trace back to earlier collections by Professor H. A. Gossard. Initials of these gentlemen will indicate the source for the species entered as also for the many Gainesville records that appear. The Gainesville locality records have a special value since so large a part of the previous records have been from coastal localities and in many cases represent only winter collecting. The value of such a list is of course dependent on the accuracy of the identification and I have endeavored to verify all the previous records as well as to satisfy myself as to the identity of the species newly entered. In any comparison with other regions for the purpose of determining the source of the fauna or the recent introduction of new arrivals it is very clear that reliable records for the regions

compared are essential. While many of the native species are important pests some of the worst enemies to agriculture are probably introductions. A prompt recognition of new arrivals may serve a very useful purpose in preventing or reducing their destructive increase or distribution.

Note. Collections made by the writer during the winter of 1921 at St. Petersburg, Tampa, Key West, Homestead, Miami, Delray, West Palm Beach, Canal Point, LaBelle, Ft. Myers, Manatee, Ruskin and Gainesville have extended the known range of a number of the species as well as adding a number not hitherto recognized in the state. The latter are marked with an asterisk—*.
