Technical and Bibliographic Notes / Notes techniques et bibliographiques

The Institute has attempted to obtain the best original copy available for filming. Features of this copy which may be bibliographically unique, which may alter any of the images in the reproduction, or which may significantly change the usual method of filming are checked below.

- Coloured covers / Couverture de couleur
- Covers damaged / Couverture endommagée
- Covers restored and/or laminated / Couverture restaurée et/ou pelliculée
- Cover title missing / Le titre de couverture manque
- Coloured maps / Cartes géographiques en couleur
- Coloured ink (i.e. other than blue or black) / Encre de couleur (i.e. autre que bleue ou noire)
- Coloured plates and/or illustrations / Planches et/ou illustrations en couleur
- Bound with other material / Relié avec d'autres documents
- Only edition available / Seule édition disponible
- Tight binding may cause shadows or distortion along interior margin / La reliure serrée peut causer de l'ombre ou de la distorsion le long de la marge intérieure.
- Blank leaves added during restorations may appear within the text. Whenever possible, these have been omitted from filming / Il se peut que certaines pages blanches ajoutées lors d'une restauration apparaissent dans le texte, mais, lorsque cela était possible, ces pages n'ont pas été filmées.
- Additional comments / Commentaires supplémentaires:

L'Institut a microfilmé le meilleur exemplaire qu'il lui a été possible de se procurer. Les détails de cet exemplaire qui sont peut-être uniques du point de vue bibliographique, qui peuvent modifier une image reproduite, ou qui peuvent exiger une modification dans la méthode normale de filmage sont indiqués ci-dessous.

- Coloured pages / Pages de couleur
- Pages damaged / Pages endommagées
- Pages restored and/or laminated / Pages restaurées et/ou pelliculées
- Pages discoloured, stained or foxed / Pages décolorées, tachetées ou piquées
- Pages detached / Pages détachées
- Showthrough / Transparence
- Quality of print varies / Qualité inégale de l'impression
- Includes supplementary material / Comprend du matériel supplémentaire
- Pages wholly or partially obscured by errata slips, tissues, etc., have been refilmed to ensure the best possible image / Les pages totalement ou partiellement obscurcies par un feuillet d'errata, une pelure, etc., ont été filmées à nouveau de façon à obtenir la meilleure image possible.
- Opposing pages with varying colouration or discolourations are filmed twice to ensure the best possible image / Les pages s'opposant ayant des colorations variables ou des décolorations sont filmées deux fois afin d'obtenir la meilleure image possible.

This item is filmed at the reduction ratio checked below / Ce document est filmé au taux de réduction indiqué ci-dessous.

| 10x | 14x | 18x | 22x | 26x | 30x |
|-----|-----|-----|-----|-----|-----|
| 12x | 16x | 20x | 24x | J | 28x |

The copy filmed here has been reproduced thanks to the generosity of:

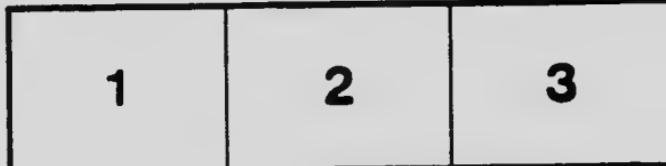

Stauffer Library
Queen's University

The images appearing here are the best quality possible considering the condition and legibility of the original copy and in keeping with the filming contract specifications.

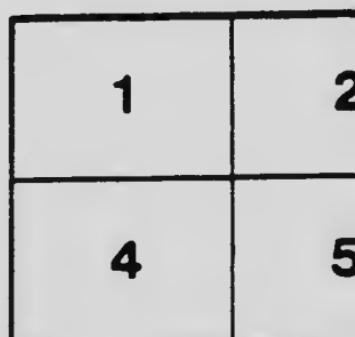

Original copies in printed paper covers are filmed beginning with the front cover and ending on the last page with a printed or illustrated impression, or the back cover when appropriate. All other original copies are filmed beginning on the first page with a printed or illustrated impression, and ending on the last page with a printed or illustrated impression.

The last recorded frame on each microfiche shall contain the symbol → (meaning "CONTINUED"), or the symbol ▽ (meaning "END"), whichever applies.

Maps, plates, charts, etc., may be filmed at different reduction ratios. Those too large to be entirely included in one exposure are filmed beginning in the upper left hand corner, left to right and top to bottom, as many frames as required. The following diagrams illustrate the method:

:

L'exemplaire filmé fut reproduit grâce à la générosité de:

**Stauffer Library
Queen's University**

Les images suivantes ont été reproduites avec le plus grand soin, compte tenu de la condition et de la netteté de l'exemplaire filmé, et en conformité avec les conditions du contrat de filmage.

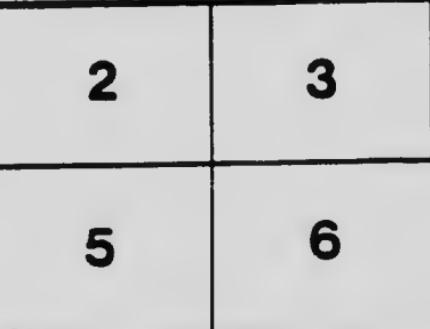

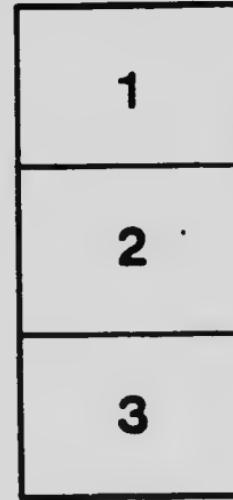

Les exemplaires originaux dont la couverture en papier est imprimée sont filmés en commençant par la premier plat et en terminant soit par la dernière page qui comporte une empreinte d'impression ou d'illustration, soit par la second plat, selon le cas. Tous les autres exemplaires originaux sont filmés en commençant par la première page qui comporte une empreinte d'impression ou d'illustration et en terminant par la dernière page qui comporte une telle empreinte.

Un des symboles suivants apparaîtra sur la dernière image de chaque microfiche, selon le cas: le symbole → signifie "A SUIVRE", le symbole ▽ signifie "FIN".

Les cartes, planches, tableaux, etc., peuvent être filmés à des taux de réduction différents. Lorsque le document est trop grand pour être reproduit en un seul cliché, il est filmé à partir de l'angle supérieur gauche, de gauche à droite, et de haut en bas, en prenant le nombre d'images nécessaire. Les diagrammes suivants illustrent la méthode.

Vol. III 54698-1

Issued July 11th, 1919

Hemiptera of the Canadian Arctic Expedition

By EDWARD P. VAN DUZEE.

The small collection of Hemiptera taken by the Canadian Arctic Expedition contains representatives of eleven species of which one is certainly new to science and is here described as *Euscelis hyperboreus*, and another is a Saldid now first reported from North America. The softer Homoptera and Miridae are in many cases too much changed by their immersion in alcohol to admit of positive identification. All the specimens recorded here were taken by Mr. F. Johansen during the progress of the Expedition.

Ligyrocoris constrictus Say.

One specimen taken at Ketchikan, Alaska, September 10, 1916. This species has been found throughout Canada and the northern United States from the Atlantic to the Pacific Oceans.

Stenodema vicinum Provancher.

A single individual taken with the preceding. It is distributed throughout the same territory but extends somewhat farther south in the United States.

Orthotylus sp.

Bernard harbour, Dolphin and Union Strait, Northwest Territories, July 10, 1916. Nine examples. This form is very near *Orthotylus discolor* J. Sahlgren, described from northern Siberia, and may prove to be identical with that species but the present material is in too poor a condition for positive determination. They are of the same size, 3½ mm., and are thickly clothed with stiff black hairs. The base of the vertex is strongly carinate and paler, the posterior field of the pronotum and median line of the scutellum are also pale, the second segment of the antennae is about as long as the hind margin of the pronotum and distinctly paler in the male, the basal segment being shorter than the head. All these characters and those of the legs are as described by Dr. Reuter for *discolor*, but here the inner margin of the corium as well as the clavus is darker, and the elytra of the females are not shorter and distinctly paler than in the males, at least not so far as I can judge from the condition of these specimens. This form seems to belong to the group of willow-inhabiting species represented by *Orthotylus pullatus* Van D. of the western United States.

Lobopidea sp.

Bernard harbour, Northwest Territories, August 10, 1915. One discoloured and fragmentary specimen certainly represents a small brachypterous species of this genus which was probably green in life.

Limnoperus rufoscutellatus Latreille.

Ketchikan, southeastern Alaska, September 10, 1916. Four examples taken running on the surface of a pond. Widely distributed in the northern portions of Europe and America.

Chiloxanthus stellata Curtis.

This large salpid seems to be common in Arctic America. Mr. Johansen took adults at Demarcation point, Alaska, May 16, 1914; west of Kongeneyik, Camden bay, Alaska, July 4, 1914; about the margins of a tundra pond; at Bernard harbour, Northwest Territories, July 15, 1915, and August 4 and 25, 1915; and the young at Collinson point, Alaska, September 13, 1913; Collinson point, Alaska, June 25, 1914; and Bernard harbour, Northwest Territories, June 20, 1916. The Philadelphia Academy of Sciences possesses a good series taken near the mouth of the Mackenzie river.

Calacanthia trybomi J. Sahlberg.

Collinson point, Alaska, six adults taken June 23, 1914, and one young, apparently of this species, taken at Bernard harbour, Northwest Territories, July 19, 1915. These adults agree in all respects with the descriptions of *trybomi* by Sahlberg and Reuter and there can hardly be a question of their identity. It is its first-recorded occurrence in North America.

Arctocorixa sp.

Two examples taken from a tundra pond at Teller, Alaska, August 6, 1913.

Euscelis hyperboreus n. sp.

Related to *extrusus* Van D. and *alpinus* Ball, but smaller and narrower than either; pale markings on the vertex forming an angled line at apex, a transverse line between the ocelli, and two quadrate spots occupying the base; fuscous margins of the elytral nervures composed of segregated irrorations. Length, 4-4½ mm.

Vertex quite strongly produced, forming a right angle in the female, its median length one half the basal width, the length next the eye two-thirds that on the median line; in the male distinctly shorter; passage to the front well rounded. Front broad and short, the sides slightly incurved to the base of the clypeus. Clypeus broad, oblong, the sides rectilinear and scarcely approaching at apex. Lobe broad, almost reaching the margins of the cheeks below. Pronotum one-fourth longer than the vertex in the female - nearly a half longer in the male. Elytra short, scarcely surpassing the abdomen in the male; attaining the middle of the fifth tergal segment in the female; the costa strongly arcuate with the apex rounded.

Valve of the male as long as the ultimate ventral segment, triangular; plates broad, truncate at apex, together almost quadrangular, their margins with a few stiff bristles. Styles but little surpassing the plates, attaining the apex of the anal tube. Last ventral segment of the female short, broadly excavated; pygofer broad, triangularly narrowed beyond the apex of the last ventral segment.

Colour yellowish testaceous becoming paler beneath and a little tinged with fulvous on the abdomen. Vertex fuscous before an arcuated line either side on the anterior margin from the tip to the ocelli; a transverse line across the surface between the ocelli, and the disk posteriorly pale, the latter divided into two quadrate spots by the fuscous median line. Face fuscous, median line and lateral areas of the front, sides of the clypeus and disk of the lobe and cheeks pale. Pronotum dusky posteriorly, the anterior submargin marked with a concentric row of about ten dark points. Scutellum with the margins pale and calloused on the basal one-half and the basal angles more or less marked with pale. Elytral nervures pale, mostly margined with lines composed of fuscous irrorations. Legs pale, varied with fuscous, the anterior and intermediate femora

being twice-banded. Edge of the connexivum fulvous, the narrow hind edge of the tergal segments and the disk of the fifth and sixth in the female pale.

Described from one male from west of Kongeneyik, Camden bay, Alaska, June 27, 1914, and one female from Bernard harbour, Northwest Territories, July 15, 1915. This species approaches *alpinus* in the shape and markings of the vertex and *extrusus* in the colouration of the elytra, but it is smaller and narrower than either, being scarcely longer than *striatus*.

Holotype, male, in the National collection of Insects, Ottawa.

Allotype, female, in collection of the California Academy of Sciences.

Euscelis sp.

West of Kongeneyik, Camden bay, Alaska, June 27, 1914, one example taken in the shelter of the tundra bluffs. This form is very near *Deltoccephalus harrimani* Ashmead, also from Alaska, and it probably is that species, but it is impossible to identify it positively from Ashmead's description.

Thamnotettix sp.

Ketchikan, southeastern Alaska, taken on grass, September 10, 1916; one damaged specimen. This pertains to the *inornata* group, and perhaps most closely resembles *titus* Ball.
